USXS-R Filter Searches

Use the following searches in any Grid in USXS-R:

- =value or .eq value will select all records equal to the value entered
- > value or .gt value will select all records greater than the value entered
- >= value or .ge value will select all records greater than or equal to the value entered (default behavior for numeric fields)
- < value or .lt value will select all records less than the value entered
- <= value or .le value will select all records less than or equal to the value entered
- <> value or .ne value will select all records not equal to the value entered
- ~ value or .like value will select all records starting with the value entered (only works for text fields; this is the default behavior for text fields if no operator is entered)
- *= value1,value2,value3 etc. or .oneOf value1,value2,value3 etc. will select records containing one of the values listed (NOTE: only works for numeric fields)
- value1..value2 or .between value1,value2 will select records between the values listed

Note: The default for any text search fields is to select fields starting with the value that you enter. You may also include '%' as a wildcard to find fields containing a value. For example, '%abc%' would select records with 'abc' anywhere in the field. The default for date fields and other numeric fields is to select values greater than or equal to the value entered.
